Regression potential explanatory variables in the multiple regression anal-analysis also was used to develop an estimation equation for yses were bankfull width, mean bankfull depth, bankfull cross-bankfull discharge. To help ensure that relations between the sectional area, width depth ratio, flood-prone width, entrench-various design-peak discharges and the channel-morphology ment ratio, the D streambed-particle size, water-surface slope characteristics would be linear, all variables were converted to 50 (determined from the water-surface profiles), and an index base 10 logarithms (log), so that the...
