I actually started out looking at this publication. It normally is not going to cost too much. I am just happy to let you know that this is basically the finest publication i have got read through within my very own life and may be he very best publication for possibly.

More detailed knowledge of the scattering process would also be of great aid in understanding certain aspects of gas discharges. The simplest case of this sort is the scattering of electrons by hydrogen atoms. Measurements of the cross section for this system have been made by Bederson in the energy range above 2 volts. However, experiments for the energy range from zero electron energy to thermal energy, a range of practical interest, are extremely difficult to carry out. At present there exists no data for this energy range. In order to gain some knowledge of the low-energy scattering it is necessary to carry out a theoretical calculation. The problem of the scattering of electrons by hydrogen atoms is a three-body problem and thus not amenable to exact solution. One is therefore compelled to seek approximate methods of solution. The first attempts to solve the problem consisted in replacing the three-body problem by the scattering of an electron by a center force. One thus considered the scattering of electrons by a Hartree field or by a Fermi-Thomas statistical potential. These approximations suffered from some serious deficiencies. For one thing they did not take account of the polarization of the atom by the field of the incident electron, nor did they adequately provide for the consideration of exchange effects which are extremely important for low-energy scattering.
