A quantity of gas admitted into an empty closed space spreads itself almost instantly throughout the space. The distribution of the substance is very nearly uniform. When a very large quantity of an easily condensable gas is forced under pressure into a limited space, a portion of the gas may be liquefied, and the substance will then be seen to be separated in the vessel into two parts. One of these has the ordinary characteristic appearance of a liquid; and the other is lighter and gaseous, and occupies the upper part of the vessel. In this case, however, the gaseous part of the substance is not properly termed gas, but should rather be termed steam of the liquid beneath. 49. Weight of Gases.--This...
